Summary of progress since 11/18 meeting: We cloned the Fritter React App, so we have a React server up and running. A user can signup and login with a username and password. We modified the React components for the user's homepage, so we have a template for viewing users' parties, and for the create party modal. The create party modal allows a host to add guests by email and supplies, and creates a party document in the database when submitted. We've written most of our routes and model functions, and coordinated their APIs.

Achieved Milestones
1. Create basic react app
2. Start login page react
3. Start homepage react
4. Start new party react
5. Create schemas
6. Begin model functions

Missed Milestones
1. Finish react components

Difficulties Encountered
- Determining how to invite users to a party and allow them to signup with the app
- Linking routes to model functions
    - When merged model functions, broke login

Changes to problem analysis or design
- When users register, must be tied to email
